## 01 Data intake

Process

Feed your operational data into the system

Analyze360 ingests your maintenance records, parts inventory, technician schedules, and dispatch history. The more data you provide, the sharper the analysis becomes.

Upload data

## 02 Analysis engine

Our algorithms run thousands of scenarios to find the optimal balance. We test different inventory levels to find the optimal balance between reliability and cost.

# Questions

Find answers about how Analyze360 works for your operation

How much data do I need?

Start with your maintenance records and dispatch history. The system works with whatever you have, though more complete data produces sharper recommendations. Most operators upload six months to a year of operational records.

Can I integrate existing systems?

Analyze360 connects to most maintenance management platforms and inventory systems. Our team handles the integration so you don't have to worry about compatibility or data migration.

What if my operation is small?

The platform scales to any size operation. Regional carriers and smaller fleets benefit just as much as larger networks. The analysis adapts to your specific staffing levels and inventory constraints.

How often should I run analysis?

Run it quarterly to catch seasonal shifts in demand. Some operators analyze monthly during peak seasons. The system flags when significant changes warrant a fresh look at your allocations.

Is the 99.5% target guaranteed?

Analyze360 shows you what inventory and staffing levels achieve that target. The actual results depend on execution. Our recommendations are based on your real operational data and proven scenarios.
